Obstructive Sleep Apnoea-Hypopnea Syndrome

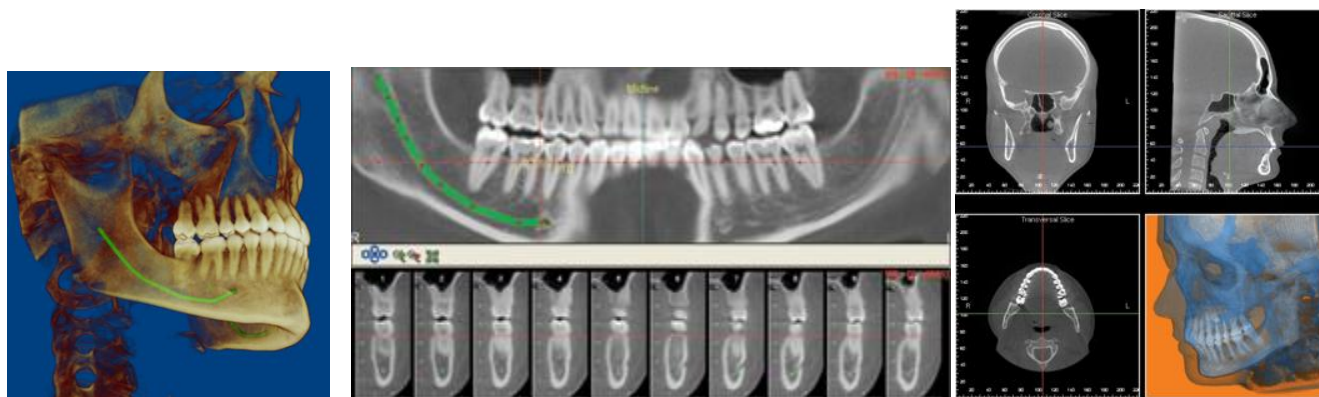

DMDI has now advanced its unique facility to incorporate the use of Dolphin Software. This unique program will enable us to offer the referrer a comprehensive assessment of the measurements required to determine the individual patient's profile. This will give you a greater perspective to treat patients with this condition.

Leading Sleep Medicine & Special needs Dentists have been sending their patients to DMDI for the full Sleep Apnoea study with great results to date. With the use of Dolphin software very clear and precise images are obtained to give the best results to the referring Doctor to make the best diagnosis for this treatment.

Shown below are some of the key features we can offer.

3D Nerve Marking

We can identify and isolate the nerve canals on a panoramic projection within 3D rendering of the skull volume. This is extremely useful when considering implant placement.

Multiple Planar Views

This will give orthogonal projected slices, sagittal, coronal and axial planes, creating a complete cross-sectional analysis.

Analysis of Airways

We can now draw the borders around selected portions of the volumetric scan and identify the airway space within the borders, as well as the most constricted portion of the airway.

This is an excellent tool to assist in a tailored device for a particular patient.

If you would like further information on referring sleep apnoea patients please contact DMDI and speak with our radiographer.

DMDI would like to thank everyone for their support in 2009 with the opening of the business. We wish you a very Merry Christmas and a wonderful and successful New Year. We look forward to ongoing referrals and building strong relationships.

Office Christmas hours: Closing Thur 24th at 12 noon and returning Mon 11th Jan 2010.

This space we can offer to our readers at no charge.
